C Enterprise Ltd

Water atomizing mist generator

The SUBzero creates a water mist to cool and refresh your skin on hot dry days. In hot climates the water can also help the efficiency of your natural cooling system, by adding and vaporizing liquid on your skin.

Air Purifying Ionizer

An electronic ionizer produces masses of negatively charged ions, hazardous air born particles are then drawn to any earthed surface increasing the purity of the air.

-8°C SUBzero Element

This freezer element contains a state-of-the-art liquid which, after charging in your freezer, will drop to an incredible -8°C during use. This provides two primary functions; chilling the air flow to provide a soothing breeze; and dehumidifying and collecting the water.

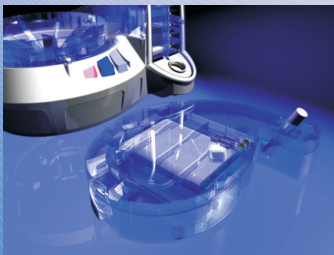

HEPA filtration

In dusty or polluted environments the addition of a 3 Layer HEPA filter will eliminate 99.8% of all airborne particles. Thus mechanically cleaning your personal air.

Drink Holder

When your freezer is far away, but you need a cooling element, any standard drinks container can be placed into the air flow to help cool you. It's also a handy place to keep your drink in the car or on your desk.

Adaptively Powered

The SUBzero can be powered from the AC power, from a car, or with battery pack, making this a very versatile personal fan.
